

Finto

A multi-currency
banking app, built
end to end.

TypeScript

React

React Native

PostgreSQL

THE PROJECT

From a UI concept to a working product

It started as an original design for a payments app. I built the whole thing behind it — an API with a real financial ledger, a web app, and a mobile app, all sharing one backend.

15 screens

53 tests

3 apps, one API

WEB

Everything at a glance

Balances across every currency, converted into one total. Recent activity underneath.

MOBILE

The same code, at phone size

One codebase. The side rail becomes a tab bar; nothing is rebuilt.

Cards, limits, currencies

Freeze a card, set a monthly limit, open a balance in a new currency, pay anyone instantly.

ACTIVITY

Every movement, searchable

Grouped by day with running totals, filtered by income, spending or pending.

UNDER THE HOOD

Built like money actually matters

1

No floating-point money

Amounts are whole cents, never decimals. $0.1 + 0.2$ does not equal 0.3 in a computer, and on a balance that error compounds.

2

A double-entry ledger

Every payment writes matched entries that must net to zero. A payment cannot half-happen, and two at once cannot overdraw the same balance.

3

Retries are safe

Phones lose signal mid-payment. Retrying returns the original result instead of charging twice.

BUILT WITH

TypeScript · Fastify PostgreSQL · React React Native

Designed and built by Marbella, with
Claude Code. The code, the tests and
the write-up are all on GitHub.
